Abstract (en)
[origin: EP4195623A1] An application interface migration system is provided, and includes a first electronic device and a second electronic device. The first electronic device is configured to: generate a migration instruction by using a first distributed service; select UI binding data based on scenario information; obtain page routing data; process the UI binding data and the page routing data to obtain to-be-migrated data; and send a recovery instruction to the second electronic device by using the first distributed service. The second electronic device is configured to: receive the recovery instruction by using a second distributed service; generate a recovery routing stack based on the page routing data, and load a first page based on the recovery routing stack and a current page routing stack; check the UI binding data based on a declaration field corresponding to scenario information; store the UI binding data in a shared data segment of a target application if the check succeeds; and refresh a component view of the first page. This application further provides an application interface migration method and a related device. This application can improve UI state migration efficiency.
