Abstract (en)  
A high-speed spinning magnesium alloy and a preparation method thereof, the magnesium alloy has Mg-Al-Zn-Mn-Sr alloy with a high formability and high strength, and its chemical composition mass percentage is: Al: 2.4<sup><sub>17</sub></sup>~<sup><sub>18</sub></sup>4.5wt.%; Zn: 0.6<sup><sub>19</sub></sup>~<sup><sub>20</sub></sup>1.2wt.%; Mn: 0.4<sup><sub>21</sub></sup>~<sup><sub>22</sub></sup>0.6wt.%; Sr: 0.15<sup><sub>23</sub></sup>~<sup><sub>24</sub></sup>0.3wt.%; the balance is Mg. The present invention adopts the principle that by increasing the content of Mn in the magnesium alloy, a large amount of Mn-rich phase is generated during the alloy preparation process, and the degree of subcooling is controlled so that a fine spherical dispersed nano-scale Mn-rich phase is obtained during the solidification process. The nano-scale Mn-rich precipitate phase can pin the grain boundaries and inhibit the grain boundary migration to refine grains and achieve the effect of improving the strength. The divorced eutectic Mg<sub>17</sub>Al<sub>12</sub> phase generated during the casting process will deteriorate the structure, so Sr is added to the alloy, Sr combining with Al to suppress the coarse phase of divorced eutectic Mg<sub>17</sub>Al<sub>12</sub>, refine the grains, increase the amount of eutectic, and reduce the risk of thermal cracking of large-size cast bars. In addition, Sr weakens the texture during the high-temperature spinning forming process and reduces the risk of cracking during the spinning tension, which is beneficial to high-speed spinning forming.
