Abstract (en)
The present disclosure relates to a latch arrangement (1) for a door (100). The latch arrangement (1) comprises: a first latch element (2) adapted to be arranged to a first door element (100); a second latch element (3) adapted to be arranged to a second door element (110) and adapted, when arranged thereto, to be moveable relative the second door element (110) between a first position (P1) where it is able to disengage from the first latch element (2), and a second position (P2) where it retains the first latch element (2) in a locked position, wherein the second latch element (3) comprises a slot (32) for receiving an engaging portion (21) of the first latch element (2), which slot (32) is adapted in size and shape to guide the engaging portion (21) into a retaining space (31) of the second latch element (3) as the second latch element (3) moves toward the second position (P2); the second latch element (3) is adapted to displace the first latch element (2) as the second latch element (3) moves from the first position (P1) to the second position (P2) so that the first door element and the second door element are pressed toward each other, and the second latch element (3) is adapted to move between the first position (P1) and the second position (P2) by means of a translational motion.
