Abstract (en)

[origin: WO2022156858A1] The present invention relates to a buttock support (1) for at least partial load-relief of the body weight of a person (9), at least comprising a receiving means (11) for receiving at least part of a buttock region of the person (9), and to a load-relief system (4) comprising the aforementioned buttock support (1). The buttock support (1) is characterised in that the receiving means (11) comprises two support regions (13) which are separated from one another by a gap (14), wherein the support regions (13) are rounded with respect to the top face (OS) and the front face (VS) of the receiving means (11); and wherein the gap (14) separates the two support regions (13) from one another centrally with respect to the longitudinal extent (LA) of the receiving means (11). The invention significantly simplifies the connection of a person (9) to the aforementioned load-relief system (4) to prepare for manual and/or automated physical therapy and also ensures that the thigh region, in particular the inner face of the thigh, and the groin region are accessible for further medical/therapeutic treatment by the medical staff.
