Abstract (en)

[origin: WO2022043371A1] An elevator system (1) has an elevator operating device (4) and an activation device (6). The elevator operating device (4) is connected to the elevator controller (13) and is located on a floor (L, L1). The elevator operating device (4) has a first radio device (5), an audio device (9) and a touchscreen (11) for the input of a destination floor desired by a passenger (P) and for the output of travel information. The activation device (6) has an actuation device (38) accessible to the passenger (P) and a second radio device (7) for radio communication with the first radio device (5); the activation device is located within radio range with respect to the elevator operating device (4). The second radio device (7) transmits an activation radio signal when the actuation device (38) is actuated by the passenger (P). The elevator operating device (4) consequently switches from a normal operating mode to a special operating mode, in which an operating instruction for a call input by the passenger (P) is generated. After a call input, the elevator operating device switches to the normal operating mode.
