Abstract (en)

[origin: WO2022043397A1] Device for recovering wave energy from a wave train, characterised in that a horizontal foil wing, located close to the shore on the sea bed, recovers the horizontal movement of the water particles as the wave trains pass and translates the forces captured into a vertical movement which is recovered and converted into electrical energy by a converter (17) housed underwater in a base (15) connected via a wired network (18) to a power plant above sea level.
