Abstract (en)  
Provided is a premises security monitoring system having a local management device, and operatively coupled to the local management device a plurality of alarm event sensors, and a radio-based location sensing arrangement to detect human presence and location within the premises that is configured to sense presence and location based on detecting perturbations of radio signals. The security monitoring system provides an interface at which a user can arm and disarm the security monitoring system, and the local management device is configured, on a user entering an instruction at the interface to arm the system for the premises, to perform a determination, based on information from the radio-based location sensing arrangement, whether the premises contain any occupants at locations remote from the interface, and if it is determined that the premises are occupied to inform the user that the premises are occupied.
