Abstract (en)

[origin: WO2022047510A1] The invention relates to a doorframe fastening for a folding door, comprising a doorframe profiled section (1) which has a securing limb (2) and a door leaf suspension (3). The aim of the invention is to provide a doorframe fastening of the aforementioned type which reliably withstands high weight loads and reduces noise emission but still allows a long-term use while avoiding cold bridges and damage from corrosion. This is achieved in that an inner support limb (7) protrudes from the securing limb (2), said inner support limb being connected to an outer support limb (9) via a thermally insulating separating web (8), and the door leaf suspension (3) is supported both on the inner (7) as well as on the outer support limb (9).
