Abstract (en)
[origin: WO2022191895A1] A method and system for providing kinesthetic awareness may include, but is not limited to, capturing a set of training data with a plurality of sensors of a kinesthetic awareness tool, analyzing the set of training data based on an impact level of the plurality of sensors and a response range of the plurality of sensors, generating a position response based on the analysis of the set of training data, comparing the position response to a target response, and generating a numerical response based on a comparison of the position response to a target response. The set of training data may include a plurality of measurements for a plurality of positions performed in at least one plane and may further include at least one of a timestamp or a marker for at least one measurement corresponding to at least one position or at least one movement.
