Abstract (en)

[origin: WO2022053559A1] The invention relates to a method for electrostatically coating a metal strip (1) with a coating material (2) using at least one nozzle bar (3), wherein: the metal strip (1) is moved in the longitudinal direction relative to the at least one nozzle bar (3); the at least one nozzle bar (3) comprises at least one slotted nozzle with a nozzle slot (3A), which slotted nozzle at least partially overlaps in the transverse direction the metal strip (1) being moved in the longitudinal direction; an electrostatic field is generated between the at least one nozzle bar (3) and the metal strip (1) via a voltage source (4); and the metal strip (1) is coated electrostatically, over at least a partial area, with at least one coating material (2). The problem of providing a method for electrostatically coating a metal strip with a coating material and a corresponding device, with which method and/or device the coating application on the metal strip can be adjusted with less effort and coating the metal strip while producing few rejects is made possible, is solved for a method by using a plurality of addressable dosing means (5) which are arranged on the at least one nozzle bar (3) distributed in the longitudinal direction thereof and with which the size of the nozzle slot (3A) of the at least one nozzle bar (3) can be modified locally during coating using a control signal.
