Abstract (en)

[origin: WO2022053172A1] The invention relates to a method for obtaining one or more air products, in which method an air fractionation plant is used which has a column system (10) with a pressure column (11), wherein the pressure column (11) is operated in a pressure range of 4 to 7 bar, wherein air is fed to the column system (10) and is fractionated in the column system (10), wherein at least 90% of the total amount of air supplied to the column system (10) is compressed to a base pressure level that lies more than 5 bar above the pressure range at which the pressure column (11) is operated, wherein nitrogen-rich gas is extracted from the pressure column (11), and wherein, at least in a first operating mode, further air is compressed to a pressure level above the base pressure level, is expanded, and is warmed without fractionation in the column system (10). It is provided that, at least in the first operating mode, a proportion of the nitrogen-rich gas extracted from the pressure column (11) is fed to the further air upstream of the expansion. The present invention likewise relates to a corresponding air fractionation plant.
