Abstract (en)
[origin: EP4212043A1] [Problem] To provide a mechanism with which it is possible to improve the quality of an experience using an inhalation device. [Solution] This inhalation device is provided with: a communication unit that communicates with another device; a heating unit that heats an aerosol source-containing substrate to generate an aerosol; and a control unit that controls the operation of the inhalation device. The communication unit receives information indicating a detection reference. The control unit detects inhalation of the aerosol by a user on the basis of the detection reference received by the communication unit.
