Abstract (en)  
An operable anti-tip assembly includes a mounting unit defining a mounting space, and a positioning unit that is disposed in the mounting space and that includes a first engaging portion. An anti-tip strut unit is inserted through the mounting unit and includes a second engaging portion. A resilient member is connected to the mounting unit and the anti-tip strut unit, and urges the anti-tip strut unit to move from the ground. The positioning unit is changeable within the mounting space between a locking state, where the first engaging portion engages the second engaging portion to prevent the anti-tip strut unit from moving relative to the mounting unit, and an unlocking state, where the first engaging portion disengages from the second engaging portion to allow the anti-tip strut unit to be urged by the resilient member to move relative to the mounting unit or the ground.
