Abstract (en)

The present invention relates to a medical device system, comprising a medical device configured to execute a program to provide therapy to a patient to alleviate a symptom of a patient; and at least one non-transitory computer readable medium configured to be executed on an external device configured to adjust the program executed by the medical device, wherein the computer readable medium contains instructions for a first algorithm, wherein the first algorithm, when executed on the external device, is configured to receive at least one qualitative measurement from the patient regarding a status of the patient, receive at least one quantitative measurement taken from the patient, and determine a wellness factor for the patient using the at least one qualitative measurement and the at least one quantitative measurement, wherein the wellness factor is indicative of a severity of the symptom, or is indicative of the status of the patient.
