Abstract (en)  
[origin: CA3191226A1] The invention relates to a device for supporting a human body in a lying position, in particular in a prone position, consisting of at least one shoulder support module and at least one pelvis support module. According to the invention, the shoulder support module and the pelvis support module consist of a first part that comes into contact with the human body, the first parts forming a pneumatic cavity comprising a valve, and the first part of the shoulder support module being kept at a pressure of less than 0.04 bar under the weight of the human body.
