Abstract (en)
The application discloses a refrigerator, comprising an outer cabinet and an inner cabinet, and a refrigerant pipe, a vacuum thermally-insulating material, a foam thermally-insulating material and a buffering member between the outer cabinet and the inner cabinet. The refrigerant flows in the refrigerant pipe. In a region where the refrigerant pipe and the vacuum thermally-insulating material are disposed, a buffering member is provided between the refrigerant pipe and the vacuum thermally-insulating material, an inner surface of the outer cabinet is connected to the refrigerant pipe, and the space between the inner surface of the outer cabinet and the vacuum thermally-insulating material is filled with the foam thermally-insulating material. When the liquid-state foam thermally-insulating material is filled, deformation does not occur on the outer surface of the outer cabinet.
