Abstract (en)
Switching operations are described that provide greater reliability for multilink operations between an access point multilink device, AP MLD, and a non-AP MLD in a wireless communications network. The AP MLD announces that the AP MLD switches one of the multilinks necessary for the multilink operation (802). The non-AP MLD determines whether an AP operating on a switching link has resumed basic service set, BSS, operation on a target channel (814).
