Abstract (en)

[origin: WO2022082076A1] A cooling applicator cools a target area of the skin to crystalize the fat cells thereunder which reduces the fat cells within the target area of the body without damaging the skin. The applicator has one or more chambers where each of the chambers define a pocket adapted to draw a target area of the skin therein such as by using vacuum pressure. As the target area of the skin is pulled into one or more pockets, the target area forms an irregular shape thereby increasing the surface area juxtaposed to the chambers and minimizing the overall thickness under the target area of the skin including the fat cells. With the increased surface area of the skin and the fat cells being closer to the chamber, the fat cells are more efficiently cooled to crystalize the fat cells while minimizing the pain.
