Abstract (en)

[origin: WO2022112538A1] A device for locking a binding to a snowboard, comprising a base (3) attached to the board and housed in an opening (7) of a base (9) of the binding, locking means which are movable relative to the base, from a locking position wherein they lock the base by overlapping the opening, to an unlocking position wherein they fit into the opening, and a clamping means (27, 33) for exerting, in the locking position, a clamping force on the base using the locking means. According to the invention, the locking means comprise a lever (10, 11) which is hinged to the base and pivots from the unlocking position, wherein the lever fits into the opening of the base, to the locking position, wherein the lever is rotated by the clamping means, in order to transmit the clamping force onto the base.
