Abstract (en)

[origin: WO2022079173A1] The present invention relates to a body, in particular a cabinet, comprising a part, e.g. a door or a panel, which is pivotable between two positions, driven by an electric motor, wherein said part actuates during its closing movement a control device that activates the motor. A separate sensor, which reacts to the movements of the control device and is arranged between the control device and the motor, is capable of modifying the motor power.
