Abstract (en)

[origin: CN116625595A] The invention relates to identification of anomalies in fluid technology systems. The invention relates to a sensor device (18, 20) for detecting anomalies in a fluidic system (10), comprising at least one sensor (18) for determining a measured value of an instantaneous flow rate in a line (14) of the system (10), and a control and evaluation unit (20), the control and evaluation unit is designed to determine the presence or absence of an abnormal situation on the basis of the at least one measurement value. The control and evaluation unit (20) is further designed to evaluate the time series of measured values in order to first determine a period duration, to determine at least one characteristic variable for at least one section of the time series of period duration, to compare the characteristic variable with a reference characteristic variable, and to determine the time series of measured values. And determining the presence of an abnormal condition if the deviation exceeds a tolerance.
