Abstract (en)

[origin: WO2022084176A1] A data processing network (1) for performing a multiplicity of successive data processing steps (2) in a redundant and validated manner, said data processing steps each being used to generate output data (4) from input data (3), wherein at least some output data (3) from a first data processing step (2) are at the same time input data (3) of a further data processing step (2), wherein at least one first data processing module (5) and one second data processing module (6) are provided for performing each data processing step (2), wherein the data processing network (1) furthermore has a comparator module (7), wherein the first data processing modules (5) and the second data processing modules (6) are designed to transmit control parameters (8) of the individual data processing steps (2) to the comparator module (7) and the comparator module (7) is designed to perform at least one comparison of corresponding control parameters (8) that have been transmitted by the first data processing modules (5) and the second data processing modules (6) and, based on this comparison, to provide at least one synchronized control parameter (9) that contains control information relating to at least one data processing step (2) that has been performed.
