Abstract (en)
[origin: WO2022085975A1] A method and apparatus for performing measurement in a deactivated state or a dormant state in a wireless communication system is provided. A wireless device receives, from a cell group, a measurement configuration including 1) at least one measurement object, and 2) an information informing whether to perform measurement on the at least one measurement object in a specific state. A wireless device enters the specific state, wherein Physical Downlink Control Channel (PDCCH) monitoring is not performed for all cells belonging to the cell group while in the specific state. A wireless device determines whether to perform measurement on the at least one measurement object in the specific state based on the received information.
