Abstract (en)

[origin: WO2022090434A1] The present application relates to the identification of the role of the protein derived from the naked cuticle homolog 2 (Nkd2) gene in the development of chronic kidney diseases, in particular advanced chronic kidney disease and renal fibrosis. The present invention relates in particular to a method for identifying compounds which bind to the nkd2 protein and to the use of Nkd2 for screening and for identifying Nkd2-interacting compounds. The invention furthermore relates to pharmaceutical compositions for use in the treatment of kidney diseases, in particular pharmaceutical compositions comprising active substances which bind to and/or inhibit the NKD2 protein (figure 1a).
