Abstract (en)

[origin: WO2022090754A1] The present invention concerns a method for extracting an additive from a material containing a polymer matrix and said additive comprising the steps of a) bringing into contact said material with a pressurized dense fluid in a device at a temperature T and a pressure p at which said pressurized dense fluid is saturated with said additive and b) creating in said device either a temperature gradient or a pressure gradient whereby said device presents a gradient of solubility of said additive with a zone of minimum solubility in which said additive precipitates or crystallizes and a zone of maximum solubility containing said material depleted in said additive, step a) and step b) being performed simultaneously or one after the other one. The present invention also concerns a multi- vessel device implemented during this extraction method.
