Abstract (en)

[origin: WO2022090431A1] The invention provides a method for operating an automotive lighting device (1) comprising at least two solid-state light modules (2). This method comprising the steps of defining a homogeneity criterion for each pair of colours, feeding the first light module with a first current value which produces a first output colour in the first light module and feeding the second light module with a second current value which produces a second output colour in the second light module, wherein the pair first output colour-second output colour fulfils the homogeneity criterion. The invention also provides an automotive lighting device (1) comprising a control element (3) to carry out the steps of this method.
