Abstract (en)
The invention is directed at a device 10 for mixing a first component 15 with a second component 19, comprising: a housing 12 forming a first chamber 14 for the first component, a second chamber 18 for the second component, a separation element 20 for separating the first chamber and the second chamber, and an activation element 22 for creating a breakthrough through the separation element, wherein the activation element is integrally formed with the housing and wherein a predetermined breaking area 24 is formed in the housing to create an outlet for withdrawing a mixture of the first component and the second component. The invention is also directed at a method of mixing a first component 15 with a second component 19, comprising: providing a device 10 with a housing 12 forming a first chamber 14 for the first component, a second chamber 18 for the second component, a separation element 20 for separating the first chamber and the second chamber, and an activation element 22 integrally formed with the housing for creating a breakthrough through the separation element, wherein a predetermined breaking area 24 is formed in the housing, further comprising creating a breakthrough through the separation element so that the first component and the second component mix, creating an outlet for withdrawing a mixture of the first component and the second component by breaking the housing at the predetermined breaking area.
