Abstract (en)

[origin: WO2023046738A1] The invention relates to a mop system (1) comprising a flat mop holder (3), which is designed to hold a mop cover (2) in a first state and to release the mop cover (2) in a second state and which comprises actuating kinematics (31) for triggering a change from the first state to the second state, and comprising a mop handle (5), which is connected or can be connected to the flat mop holder (3) at a first end (51). According to the invention, an actuation element (7) is provided, which is arranged on the mop handle (5) opposite the first end (51), in particular at a second end of the mop handle (52), and which is designed to activate the actuating kinematics (31), and at least one cable (80) is provided, which is designed to transmit an activation force and/or an activation movement from the actuation element (7) to the actuating kinematics (31) such that the mop handle (5) comprises multiple mop handle sections (53, 54) which can be adjusted relative to one another in a telescoping manner. The cable (80) comprises at least one length compensating device (74), which is designed to adjust the at least one cable (80) in a variable manner so as to correspond to a telescoping position of the mop handle sections (53, 54).
