Abstract (en)  
A hose trolley (100) with a carrier frame (112) includes a guide handle (108) and a hose drum (110). A support element (114) attached to the carrier frame (112) supports the hose trolley (100) on a ground surface (G). The support element (114) is pivotable between an operational position (PI) and a non-operational position (P2). The support element (114) is pivotable around at least one pivot opening (115) relative to the carrier frame (112) between the operational position (PI) and the non-operational position (P2). The hose trolley (100) is characterized in that the support element (114) further includes at least one protrusion (116) adapted to move between a first position (X1) and a second position (X2) relative to the support element (112) such that the at least one protrusion (116) is biased to remain in the second position (X2). The at least one protrusion (116) is enclosed within the support element (112) in the first position (X1) and extends at least partially outside the support element (112) through the pivot opening (115) in the second position (X2).
