Abstract (en)

[origin: WO2022101989A1] An indoor unit (20a, 20b) includes a controller (6a, 6b), an indoor heat exchanger (3a, 3b), an electronic expansion valve (4a, 4b), an intake thermistor (7a, 7b) that detects the temperature of taken-in air, and a discharge thermistor (8a, 8b) that detects the temperature of discharged air. The indoor unit (20a, 20b) switches to thermo-off operation when the temperature detected by the discharge thermistor (8a, 8b) reaches a reference value. The air conditioning device comprises a first inference device (32) that infers whether any of a plurality of indoor units (20a, 20b) will switch to thermo-off operation in a given period in the near future from factors including the set temperature, the temperatures detected by a plurality of intake thermistors (7a, 7b), and the temperatures detected by a plurality of discharge thermistors (8a, 8b) in a given period in the past.
