Abstract (en)

[origin: WO2022106321A1] A closure cap (1) having a top portion (2) and a cap skirt (3), wherein the cap skirt (3) has an internal thread (4), wherein an encircling tamper-evident strip (5) is arranged on an edge of the cap skirt (3) that faces away from the top portion (2), wherein at least one catch element (7) is arranged on the inner side of the tamper-evident strip (5), wherein the catch element (7) has a first stop surface (8) with a surface normal arranged at least partially tangentially to the cap skirt (3) such that the first stop surface (8), in an assembled state of the closure cap (1) with a container (11) having the container neck, is able to be brought into engagement with a first stop surface (15) of the container neck, wherein, as a result of the engagement of the two first stop surfaces (8, 15), a retaining moment counteracting an opening direction of the closure cap (1) is exerted on the tamper-evident strip (5) when the closure cap (1) is twisted in the opening direction for the first time, wherein the blocking element (9) is arranged on the tamper-evident strip (5), wherein the blocking element (9) has a second stop surface (10) with a surface normal pointing at least partially in an axial direction such that the second stop surface (10), in an assembled state of the closure cap (1) with the container (11), is able to be brought into engagement with a second stop surface (17) of the container neck, wherein, as a result of the engagement of the two second stop surfaces (10, 17), a retaining force acting in the axial direction is exerted on the tamper-evident strip (5) when the container (11) is tipped to pour out a filling material.
