Abstract (en)
[origin: WO2022107178A1] Described is a process for the production of water/oil repellent synthetic microfibre fabrics and/or leathers, which involves a step of applying wetting or hydrophilizing agents or compounds on at least a portion of one side of the fabric and/or leather. The invention also relates to a synthetic microfibre fabric and/or a leather made starting from the above-mentioned process. The fabrics and leathers can also be shaped on the lower side by applying a three-dimensional structure on the reverse side impressed in a permanent manner, which favours the presence of air channels on the internal side, in order to increase breathability and thermal comfort, thanks to the reduction of contact points. This application may take place by mechanical or pneumatic compression, thermo-forming, high-frequency or similar techniques designed for making the lower or internal side, facing the user's epidermis, three- dimensional.
