Abstract (en)
[origin: WO2022106065A1] The present invention provides a cylinder lock actuator (1) comprising a first lock cylinder (2), a second lock cylinder (3) and a clutch mechanism (13), the clutch mechanism (13) being adapted to selectively engage either the first lock cylinder (2) or the second lock cylinder (3) with a cam (10) which is held in an axially moveable manner within the cylinder lock actuator (1). Furthermore foreseen are biasing means (35), adapted to axially move the cam (10), and locking means (30, 31). Upon forced removal of second lock cylinder, cam is moved to a second position wherein locking means constrain the cam (10) with respect to the first lock cylinder (2) to avoid opening of the lock.
