Abstract (en)

[origin: WO2022106653A1] The present invention relates to a method and a device for selective provision of user data, in particular in order to provide sufficient data protection during the transmission of user data to a client. Accordingly a computer-implemented method for selective provision of user data is proposed, comprising the following steps: - authenticating (100) a user (10); - authorising (200) provision of user data of the user (10) requested by means of a central unit (14); and - providing (300) the requested user data for transmission to the central unit (14). The authorisation (100) and the provision (300) of the requested user data take place by means of a decentralised device (12), the provision (300) of the requested user data comprising the encryption (302) of user data stored on the decentralised device (12).
