Abstract (en)

[origin: WO2022106607A1] The invention relates to a method and a device for positioning the ends of winding elements (9), in particular the ends of winding elements of an electrodynamic machine comprising a plurality of adjusting tools (11) and a first drive in order to position the adjusting tools (11) in the direction of a first axis, and wherein the adjusting tools have recesses on their side surface, wherein each two adjacent adjusting tools (11) form a securing tool and the adjusting tools of the relevant securing tool have their recesses on side surfaces that are oriented towards one another such that at least one of the winding elements can be secured by fitting and/or clamping between the adjusting tools (11) of the securing tool, and a second drive is provided by means of which the two adjusting tools can be moved in the direction of a second axis such that the mutual spacing between the two adjusting tools (11) of the relevant securing tool can be changed in the direction of the second axis and each of the two adjusting tools can be fed laterally to the winding element (9).
