Abstract (en)

[origin: WO2022112110A1] The invention relates to thin metal sheets with a substantially recrystallised microstructure, having a composition, in % by weight, of Mg: 0.65 - 0.85, Fe: 0.10 – 0.20, Si: 0.05 - 0.09, Mn: ≤ 0.03 , Cu: ≤ 0.05 , Cr: ≤ 0.02 , Zn: <0.10 , Ti: ≤ 0.03 , other elements or impurities < 0.05 each and < 0.15 in total, the balance being aluminium. The method for manufacturing the products according to the invention comprises casting an alloy with a composition according to the invention in the form of a rolling plate, reheating the plate, hot-rolling, cold-rolling and annealing. The thin metal sheets according to the invention are particularly used to produce workpieces which have a complex shape and which are shaped in three spatial dimensions, in particular by stamping.
