Abstract (en)  
[origin: WO2022118102A1] The present invention relates to a device for assembling two timepiece components comprising a first timepiece component (1) and a second timepiece component (2) intended to be assembled to each other by means of at least one assembling member (3), the assembling member (3) being retained on the second component (2) and being arranged to cooperate with at least one assembling portion (12) provided on the first component (1) in order to assemble the first component (1) on the second component (2), the assembling member (3) comprising at least one resilient region (31) intended to cooperate with the assembling portion (12) of the first component (1) and arranged such that it can be deformed between a rest position and a maximum deformation position. The assembling member (3) is a part that is attached to the second component (2).
