Abstract (en)
Provided is a filter segment that suppresses the displacement of a breakable capsule even when an external force is applied thereto. A filter segment according to the present invention is a filter segment for a tobacco product, including: a filter containing fibers; and a breakable capsule embedded in the filter to be located on the central axis of the filter segment, where the filter segment has a first hardened structure that is formed of the fibers located near the breakable capsule and fused together by a plasticizer to cover the breakable capsule or a second hardened structure that is formed of the fibers located near the central axis of the filter segment and fused together by the plasticizer.
