Abstract (en)

There is herein presented an acoustic device comprising an acoustic transducer, an acoustic cavity proximate to the acoustic transducer and a membrane cover spanning the acoustic cavity; wherein upon the installation of the membrane cover the signal to noise ratio (SNR) of the acoustic transducer is reduced by less than 1.5 dB at 1 kHz as measured using the method described herein; and wherein the SNR of the acoustic device is reduced by less than 1.0 dB at 1 kHz after contact of the membrane cover with water as measured using the method described herein.
