Abstract (en)

[origin: WO2022123517A1] The present invention relates to an assembly for use in an air duct for ventilation of a building. The assembly comprises a compact control valve or a controllable valve, e.g., a supply and/or exhaust valve, with flow control means for controlling the flow of air through the valve and adjusting means to adjust the relative position of flow control means of the valve. The flow control means comprise two sub-elements that can be positioned relative to each other with a free end facing the other sub-element. The assembly further comprises an extension piece having a proximal side adapted to engage the free end of one of the sub-elements and an opposite distal side.
