Abstract (en)  
[origin: WO2022128297A1] In the past years, reduction of friction and wear has become important in the development of knitting tools. A knitting tool (1) and a knitting device (27) according to the invention are therefore suitable for reducing friction in knitting machines and for minimizing build-up of soiling matter (23) as compared to conventional knitting tools. For this purpose, the knitting tool (1), in a functional region (5), has sub-regions (7) in which the value of the slope of a center-of-gravity line (4) is greater than zero.
