Abstract (en)
[origin: WO2022129427A1] The invention relates to a lighting device (2) for a motor vehicle, comprising at least one light source (6) capable of emitting light rays; at least one collector (20) with a reflective surface (8) configured to collect and reflect the light rays emitted by the at least one light source (6) into a subsequent light beam; an optical system (10) comprising a lens function and configured to project the light beam by imaging a portion of the at least one reflective surface (8) located at the rear of the at least one corresponding light source (6); wherein the lens function is a first function, the optical system (10) comprising a second optical function, said optical system being rotatable about an axis of rotation (14) between a first position where the first function is active and a second position where the second function is active.
