Abstract (en)

[origin: WO2022128933A1] The invention relates to a method for estimating the electrical power of a photovoltaic module, present among a group i of several photovoltaic modules, said method comprising the following steps: - acquiring the following environmental parameters for the group i of photovoltaic modules: o Gh: global horizontal irradiance; o Tamb: ambient temperature; o WindSpeed: wind speed; determining a temperature (T(i,j)) of each photovoltaic module of the group i of photovoltaic modules; determining the electric power (P mppt (i)) delivered by the group i of photovoltaic modules at the maximum power point; - determining corrected environmental parameters for which each of the photovoltaic modules of the group i of photovoltaic modules supplies the corrected electrical power; - determining the corrected electric power (Pelec c (i,j)) of at least one target photovoltaic module belonging to group i of photovoltaic modules from the corrected environmental parameters.
