Abstract (en)

[origin: WO2022128932A1] The invention relates to a method for estimating the electrical power of a target photovoltaic module within a group i of several photovoltaic modules, said method comprising the following steps: - determining a temperature ($T(i,j)$) of each photovoltaic module within the group i of photovoltaic modules and selecting at least one reference photovoltaic module (M_{ref}), distinct from said target photovoltaic module; - determining a theoretical electrical power ($P_{elec(i,j)}$) supplied by the reference photovoltaic module at the reference temperature; - determining corrected environmental parameters for which said reference photovoltaic module supplies the theoretical electrical power; - determining the corrected electrical power ($P_{elec(i,j)}$) of said target photovoltaic module from the corrected environmental parameters.
