Abstract (en)
[origin: EP4266562A1] A method for manufacturing a stator for a rotating electrical machine is disclosed that includes: an installation step of installing coil pieces with a rectangular cross section for a stator coil in a stator core; and a joining step of joining ends of the coil pieces by laser welding after the installation step. The joining step includes a setting step of bringing the ends into contact with each other in a radial direction in such a manner that the ends cross over each other in an X-shape as viewed in the radial direction, and a radiation step of applying a laser beam with a wavelength of 0.6 μm or less in an axial direction toward a C-shaped side, as viewed in the radial direction, of a contact surface between the ends after the setting step. Part of the C-shaped side and part of an axially outer non-contact surface that is continuous with the contact surface between the ends are melted in the radiation step.
