Abstract (en)
[origin: WO2022139571A1] A pile mechanical locking mechanism with screwed-on grooved locking protuberance/protuberances (3), that by virtue of the flex of the non-welded, screwed-on grooved protuberance/protuberances (3) and by the locking pin/pins (7) having a small amount of contact with the grooved protuberance/protuberances (3), enables easy to install locking pin/pins (7) even with the existence of typical debris from the piling stage or even when dimensional tolerances of the pile's joint plates (1) are not ideal due to manufacturing error or damage from external forces. The mechanical locking mechanism, being open or exposed in nature, enables debris to be easily cleaned away and visual inspection of any possible physical obstructions to successful locking pin/pins (7) installations can be conducted easily.
