Abstract (en)

[origin: WO2022144303A1] The invention relates to an overtube comprising: - a body, - a first duct for accommodating a first insertion tube of a first endoscope, which first duct is created longitudinally inside said body and opens at the distal end, - a second duct for accommodating a second insertion tube of a second endoscope or another medical device, which second duct is created longitudinally inside said body and opens at the distal end, - a first orifice for introducing the first insertion tube into the first duct, - a second orifice for introducing the second insertion tube into the second duct, - a third orifice for introducing a lubricant into the first duct and into the second duct, and in which: - the first duct and the second duct communicate with one another via a communication passage, which passage opens at least at the third orifice, - an optical vision device is installed in the communication passage or in a third duct created in a wall of the body, which optical vision device opens at the distal end of said body.
