Abstract (en)
[origin: WO2022146754A1] A stream of a media item is transmitted from a server computing system to one or more client computing systems. The media item has a timeline for playback of the media item. Participant-generated content is received at the server computing system from one or more participants at any of the one or more client computing systems. The participant-generated content is time-indexed to the timeline of the media item. The participant-generated content is processed to identify key portions of the media item based on indications present within the participant-generated content. A dynamic summary queue is generated that includes the key portions of the media item. The dynamic summary queue is assembled for streaming. A request to view the dynamic summary queue is received from a requestor. In response to the request, a stream of the dynamic summary queue is transmitted to a computing device of the requestor.
