Abstract (en)

[origin: WO2022144847A1] A method is for automatically understanding expressions which represent a multiple instruction comprising at least two single instructions, each one representing an order. This method comprises, in the case of an expression being received, a first step (100) in which the multiple instruction represented by the expression received is automatically segmented into single instructions, and a second step (110) in which an application field is automatically determined from a group of application fields for each of the single instructions of the segmentation.
