Abstract (en)
[origin: EP4272600A1] A container has a base (10), a sleeving cylinder (20), a top cover (30), and a top cover open-close operating unit (40). The sleeving cylinder (20) rotatably sleeves the base (10) and has an accommodating space (200) capable of accommodating a content (52). The top cover (30) is pivotally mounted on the sleeving cylinder (20) and is capable of opening and closing the accommodating space (200). The top cover open-close operating unit (40) is moveably mounted in the main body assembly (1) and is connected to the top cover (30). When the sleeving cylinder (20) is rotated relative to the base (10), the sleeving cylinder (20) drives the top cover (30) to open or to close the accommodating space (200) via the top cover open-close operating unit (40). The container facilitates ease in operation in opening and closing.
